STAFF HANDBOOK

Five layers of our movement system,
three non-negotiable rules, and the
exercise naming taxonomy.

M MOVEMENT

Movement

The map

Every drill lives somewhere: gait/locomotion or stationary; ballistic, dynamic/integrated, or isolated; pattern type and limb involvement. Know where it sits before you prescribe.

"Before you write anything down, find it on the map."

A ASSESSMENT

Assessment

The paradigm

Ask the five questions in order. Each answer tells you where to start and where not to go yet. The paradigm is a diagnostic tool first, a teaching sequence second.

"The paradigm is a gate, not a schedule."

P PRESCRIPTION

Prescription

The variables

Exercise variables (stance, implement, surface, grip, plane, limb) and program variables (sets, reps, tempo, load, rest, density) make the same movement harder or easier without changing the pattern.

"Individualize with variables. Change the wrapping, not the movement."

P PROGRESSION

Progression

The pathway

ISO to Dynamic to Loaded to Ballistic to Speed/RSA. Advance only when the athlete shows they own the position. Adding load is the last thing you do.

"Earn the position. Own the position. Load it. Make it fast."

S SPECIFICITY

Specificity

The purpose

Every exercise connects to a physical quality, sport demand, or kinetic chain correction. If you cannot explain why an athlete is doing something, it should not be in the program.

"If you cannot answer why, it does not belong."

3 RULES — NON-NEGOTIABLE

- 1. Never load what you cannot control.** If the pattern breaks, regress immediately. No exceptions, no matter what the program says.
- 2. Always assess before you prescribe.** The paradigm tells you where to start. Do not skip it because the athlete looks fit.
- 3. Know the why behind every exercise.** If you cannot connect it to a physical quality or sport demand, cut it.

EXERCISE NAMING TAXONOMY — INCLUDE EACH FIELD ONLY WHEN RELEVANT, ALWAYS IN THIS ORDER

01 Limb Involvement	Bilateral Unilateral Single leg Single arm Alternating
02 Implement	Barbell Trap bar Safety bar Swiss bar Dumbbell Kettlebell Cable Landmine Band Flywheel Med ball Sandbag OHM Bodyweight
03 Surface	Slant board Deficit Valslide Slideboard Bosu Ramp Heels elevated Toes elevated Airex
04 Stance	Supine Prone Hook lying Side lying Tall kneeling Half kneeling Standing Staggered Split FFE RFE Single leg 90-90 Wall Seated Lateral split Lateral ½ kneeling Bent knee
05 Grip	Overhand Underhand Neutral Fat grip Parallel Close grip Wide grip Alternate Goblet Zombie Forearm Hand Front Back Off-set Rack Suitcase High bar Low bar Overhead Farmer
06 Plane	Sagittal Frontal Transverse Horizontal Vertical Rotational Lateral Crossover Cross-behind Diagonal 45 deg 90 deg 180 deg Upright Bent over Side Zig-zag Reverse Forward Altitude Drop Depth High Low Front Back
07 Movement	Squat Split squat Lunge Walking lunge Jump squat Deadlift RDL SLDL Hip hinge Hip thrust Good morning Leg curl GHR Nordic curl Press Push-up Bench press OHP Floor press Row Pull-up Chin-up Pulldown Face pull Shrug Carry Plank Pallof press Dead bug Rollout Jump Hop Bound Throw Slam
EXAMPLES	Bilateral trap bar deadlift Single leg KB deficit split squat Single arm DB neutral half kneeling row Landmine lateral lunge Push-up

MOVEMENT PARADIGM — 5 QUESTIONS EVERY ATHLETE, EVERY MOVEMENT

- Can you get into position?**
Isometric (ISO) — joint mobility, stability, motor control
- Can you get in and out of position?**
Dynamic — bodyweight movement quality through full range
- Can you get in and out of position under load?**
Loaded Dynamic — Strength; pattern integrity under resistance
- Can you get in and out of position with speed?**
Ballistic — power, rate of force development, plyometrics
- Can you get in and out of position with speed, repeatedly?**
Ballistic / Speed Endurance, RSA — motor capacity under fatigue

"Earn the position. Own the position.
Load it. Make it fast."
